- Pluxee Login Process

1. Objective & Scope

This section extends the existing onboarding PRD (business and general user onboarding) to cover **employee onboarding when invited by employers for benefit cards** in India.

Objective

- Enable employers (corporates) invite their employees into a **use case offered by Tide (Benefit/Expense)** proposition (e.g., meal/fuel/telecom/rewards wallets).
- Ensure invited employees follow a **use case (Benefit/Expense) specific onboarding flow**, distinct from the Business current account onboarding flow.
- Support both **new** and **existing** Tide members, with clear behaviour based on their KYC status (KYC0 / RM / Full KYC).
- Respect India-specific practices and constraints (e.g., mobile-first, email optional, corporate-led benefit programmes, RBI/PPI norms around KYC tiers).

Note: Members can not be linked to more than 1 corporate at a time. Conflicts mentioned [here](#).

In Scope (for this section)

- Employer-side **bulk lead registration** and invite creation for employees.
- Data and identifier requirements for employees (employee ID, mobile, optional email, system-generated unique ID (Business Id), product code embedded in invite).
- Employee onboarding journey after invite:
 - New Tide members (no existing relationship).
 - Existing Tide members (KYC0 / RM / Fully KYCed).
- How employees see and accept invited use case (benefit card) invitations.
- How employers see employee onboarding status and final onboarded details in **Employee Management**.
- Key scenarios and edge cases related to use case (benefit card) invites and onboarding.

Note: Not all the employee data to be shared with BIDM, the custom field data should be stored in SP service.

Explicitly Out of Scope (for this section)

- Detailed benefit configuration at invite time, including but not limited to:
 - Wallet mix (Meal/Fuel/Telecom/Rewards, etc.).

- Limits and load rules.
- Employer-specific programme rules and entitlements.
- Low-level technical details (APIs, database design).

- **Module A: Employer Lead Management (Input)**

- BC-INV-01: Bulk Lead Registration & Validation
- BC-INV-02: Single Lead Entry Interface
- BC-INV-03: Duplicate & Conflict Validation Logic

- **Module B: Invitation Engine (Backend)**

- BC-ENG-01: Invite Record Generation & Product Code
- BC-ENG-02: Multi-Channel Invite Dispatch (SMS/Email)

- **Module C: Employee Onboarding & Routing (Frontend/Logic)**

- BC-ONB-01: Smart Routing via Product Code (Target product definition stays)
 - Onboarding:
- BC-ONB-02: New Member use case (Benefit/expense) Onboarding Flow
- BC-ONB-03: Existing Member Detection & KYC-Based UX
- BC-ONB-04: In-App Program Acceptance (Banner/Card) based on product code

- **Module D: Employee Management Dashboard (Employer View)**

- BC-DSH-01: Onboarding Status Tracking
- BC-DSH-02: Post-Onboarding Data Synchronisation (Source of Truth)

2. Roles & Definitions

- **Employer / Corporate Admin**

- A business customer that already holds a Business current account and is authorised to manage employees with all roles and permission assigned. (In India Corporates will have paper account)
- Uses Tide Portal to upload employee lists and send invites for both use case (benefit/expense)

- **Employee / Beneficiary**

- An individual invited by the Employer to receive and use benefit cards / expense
- May or may not have an existing relationship with Tide (new vs existing member).

- **Existing Tide Member**

- An individual who **already has a user account** (e.g., prior business relationship, previous product).
- May be:
 - KYC0 / RM (minimal or restricted KYC).
 - Fully KYCed (full KYC as per RBI/PPI norms).

- **KYC Tiers (India Context)**

- **KYC0 / RM** : Limited-use / restricted KYC state (e.g., lower limits, restricted functionality).
- **Full KYC C**: Fully verified as per RBI PPI / banking guidelines, eligible for broader usage and higher limits.

- **Employee Management Page**

- The Employer's view listing invited employees for benefit cards/expense, with:
 - Employee identifiers (Employee ID, Emp Code, etc.).
 - Contact details (mobile, optional email).
 - Onboarding status and final information as used by the employee during onboarding.

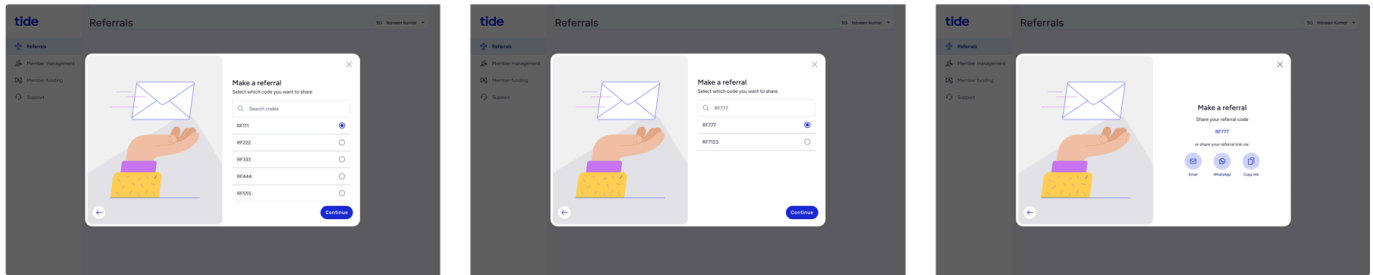

- **Product Code (Benefit Card/Expense/Payout)**

- An internal code that identifies the use case - **benefit-card/expense-specific product configuration for the corporates** (as distinct from Business current account onboarding).
- Embedded in the invitation link so the correct flow is triggered.

- **Current Offering under Benefit Cards:**

- Product code assigned are Benefit card and RuPay

Current Invite Flow SP IN

- Combination of use case can be assigned with the referral code, a few examples:
 - Expense and Rupay
 - Expense and Visa
 - Expense, VISA and Instant Card
 - Expense, Rupay and Instant Card
 - Benefit, Rupay and Instant card
 - Benefit, Rupay

The image shows a form titled 'UPI_QR' with a list of checkboxes for various product codes: INSTANT_CARD, VKYC_PRIORITY, UPI_QR_KYX_QUEUE, VISA_CARD, and RUPAY_CARD. Below the list is a dropdown menu labeled 'Select target product'.

Aligned Scenario:

- Existing member - KYC0/RM/Fully KYC
 - Update the referral code from BE for the business ID
 - Don't update if the member has referral code
 - If invited for benefit and member has expense referral, do not update.
 - If invited for expense and referral code is expense then update the referral code (Not required in current phase)
- New Employee
 - Referral code link will be shared which will applied for the business.

Product code combination which can be applied for the employee/LM

#	Product Code Combination	New Member	Existing Member (KYC0/RM)	Existing Member (Fully KYCed)	Comments / Notes
SINGLE PRODUCT CODES					
1	Benefit Card (RuPay network	Benefit wallets journey to initiated	Benefit wallets activation banner	Benefit wallets activated on	issue a Rupay card by itself

	card is provided with benefit cards)		to be shown	existing account	
2	Visa	Visa card issued (home delivery)	Visa card issued (home delivery)	Re-carding to Visa if currently on RuPay; no change if already Visa	Card network assignment
3	RuPay	RuPay card issued (home delivery)	RuPay card issued (home delivery)	Re-carding to RuPay if currently on Visa; no change if already RuPay	Card network assignment
4	Instant Card	N/A - Must be combined with card network	N/A - Must be combined with card network	N/A - Must be combined with card network	Instant Card is a modifier, not standalone
5	UPI_QR	UPI QR enabled; no card issued	UPI QR enabled on existing account	UPI QR enabled on existing account	Enables UPI QR payments
6	VKYC Priority	Prioritized for Video KYC processing	Prioritized for Video KYC upgrade to Full KYC	N/A - Already Fully KYCed	Relevant for KYC completion
7	UPI QR KYX Queue	Placed in UPI QR KYX queue; UPI QR enabled	Placed in UPI QR KYX queue; UPI QR enabled	N/A - Already Fully KYCed	Special processing queue for UPI QR + KYX
TWO PRODUCT CODE COMBINATIONS					
8	Benefit Card + Visa (not in current phase)	Benefit wallets activated; Visa card issued (home delivery)	Benefit wallets activation banner to be shown; Visa card issued (home delivery)	Benefit wallets activated; re-carding to Visa if currently on RuPay	Valid combination
9	Benefit Card + RuPay	Benefit wallets activated; RuPay card issued (home delivery)	Benefit wallets activation banner to be shown; RuPay card issued (home delivery)	Benefit wallets activated; re-carding to RuPay if currently on Visa	Valid combination
10	Benefit Card + Instant Card	Benefit wallets activated; no card issued	Benefit wallets activated; no card issued	Benefit wallets activated; no card issued	Instant Card requires network specification

63	Visa + RuPay + UPI QR KYX Queue	INVALID COMBINATION	INVALID COMBINATION	INVALID COMBINATION	Cannot have both Visa and RuPay simultaneously

Aligned Scenario:

- Existing member - KYC0/RM/Fully KYC
 - Update the referral code from BE for the business ID
 - Don't update if the member has referral code
 - If invited for benefit and member has expense referral, do not update.
 - If invited for expense and referral code is expense then update the referral code (Not required in current phase)
- New Employee
 - Referral code link will be shared which will applied for the business.

3. High-Level Flow Overview

1. Employer prepares employee list

- Via bulk upload (CSV/Excel) or manual addition.
- Provides **Employee ID**, **mobile number** (mandatory), optional **email**, and optional internal mapping attributes (Emp Code, Subsidiary, Location, etc.).

2. System registers leads and generates invites

- Creates an **employee invite record** per employee.
- Assigns a **system-generated unique identifier** and associates a **product code** for the benefit card/ expense proposition.
- Sends invite via SMS and/or email, based on available contact details.

3. Employee receives invite and starts onboarding

- Clicks the invitation link (from SMS/email).
- Link triggers the **Benefit Card/Expense onboarding flow**, not the Business current account flow.

4. Employee onboarding behaviour depends on membership & KYC state (use Referral code)

- **New member:** Proceeds through a simplified benefit-card/Expense onboarding/KYC journey.
- **Existing member (KYCO / RM):** Sees a clear entry point within their existing app session (banner/CTA) to accept the employer's programme and complete KYC if needed.
- **Existing member (Full KYC):** Sees an invitation card/notification on the Home tab to accept the employer programme; post-acceptance, relevant wallets become visible. Lookup for the mobile number, if available then attach the referral code.
 - Invited: Expense —→ Benefit card

5. Employer visibility

- In **Employee Management**, Employer sees:
 - The employee record and onboarding status (to be aligned with doc [here](#)).
 - The **final information** used at onboarding (e.g., final name, mobile, email where provided), regardless of minor differences from the original bulk-file input, as long as the invite was used.

4. Detailed Flows by Persona

4.1 Employer – Bulk Lead Registration & Invite Creation

Key Requirements

- **Email must NOT be mandatory.**
 - **Mobile number** and **Employee ID** are primary.
 - Email is optional; can be provided if available.
- Employer can include additional attributes for internal mapping:
 - Emp Code (if different from primary Employee ID).
 - Subsidiary.
 - Location.
 - (Optional) Cost Center / Department (future-safe; not mandatory).
- For each invited employee:
 - Employer must provide:
 - **Employee ID** (from employer).
 - **Mobile number** (primary contact).
 - System will assign:
 - A **system-generated unique identifier** for the invitee record (e.g., EmployeeInviteID).
 - A **product code** indicating use case (benefit-card/expense)-specific onboarding. (This information should come from employee configuration. The product code assigned to the corporate at the time of onboarding)
- Leads can be created via:
 - **Bulk upload** (CSV/Excel).
 - **Single/manual entry** (for pilot or small numbers).

Core Behaviour

- For each uploaded/entered employee record:
 - Validate **Employee ID** and **mobile number** presence and format.
 - Optionally validate email format if provided.
 - Generate an **employee invite record**:
 - Fields include Employee ID, mobile, optional email, empirical attributes (Emp Code, Subsidiary, Location, etc.), system-generated unique identifier, and product code.
 - Generate an **invitation link** embedding:
 - Product code.
 - Employee invite record to identify the employee
 - Employer/Corporate ID and programme context (where applicable).
 - Send invitation via:

- **SMS** (primary, using mobile number).
- **Email** (if provided).

Main Flow Table – Employer Perspective

Scenario	Input (Employer)	System Behaviour	Employee Experience	Employer View (Employee Mgmt)	Notes / Open Points
Bulk upload with mobile only	Employee ID, mobile; no email; Emp Code/Subsidiary/Location optional	Validate file; create invite record with unique ID & product code; send SMS invite	Receives SMS with benefit card/expense invite link	Sees employee row with Employee ID, mobile, status “Invited”, and stored attributes	Need final decision on max file size, validation error handling
Bulk upload with mobile + email	Employee ID, mobile, email; Emp Code/Subsidiary/Location optional	Same as above; send both SMS and email invite (where policy allows)	Receives both SMS and email with same invite link	Sees employee row with Employee ID, mobile, email, status “Invited”	Consolidate multi-channel delivery rules (SMS+email vs one primary)
Single/manual entry	Employer enters one employee via UI	Create invite record & send SMS/email similar to bulk	Same as above	Same as above	Used for corrections / small batches

Employee Information Visibility (Employer View)

- For **both new and existing members** who complete onboarding using the **invited SMS/email**:
 - Employer's **Employee Management** must display:
 - Final Name (as captured/verified during onboarding, KYC Name).
 - Mobile (as actually used at onboarding; if changed via the flow, Provide during KYC).
 - Email (if captured/verified during onboarding, KYC Email).
 - Original attributes (Employee ID, Emp Code (System generated), Subsidiary, Location).
 - If there is a mismatch with original file input (e.g., employer entered “Rahul K”, onboarding captured “Rahul Kumar”), the **onboarded values** should be displayed as primary reference, with original values retained for audit.

4.2 Employee – New to Tide

Core Requirements

- New employee (no existing Tide account) receives SMS/email with invite link.
- On clicking the link:
 - The **product code/use case** ensures the **Benefit Card/Expense onboarding** is initiated, not Business current account onboarding.

- The benefit-card onboarding journey is:
 - Focused on **employee identity & KYC**.
 - Aligned with PPI KYC levels (KYC0 / RM vs Full KYC) as per regulatory requirements. (Onboarding flow)

High-Level New Employee Flow

1. Employee clicks invite link from SMS/email.
2. System checks if mobile/email is already associated with a Tide account:
 - If **no match** → treat as **new Tide Member**.
3. Employee is guided through **benefit-card onboarding**:
 - Mobile verification (OTP).
 - Basic personal information (Name, DOB, etc.).
 - KYC steps according to Full KYC (KYC0 or Full KYC; exact journey may be defined in core KYC PRD).
4. On successful onboarding:
 - Benefit card/wallet(s) are created and linked to:
 - The **Employer's programme**.
 - The **employee invite record** (Employee ID, Emp Code, etc.).
5. Employer's Employee Management updates:
 - Status to "Active".

New Employee Flow – Main Scenarios

Scenario	Input (Employer)	System Behaviour	Employee Experience	Employer View (Employee Mgmt)	Notes / Open Points
New employee invited with mobile only	Employee ID, mobile	Invite created; SMS sent; benefit product code embedded in link	Clicks link, sees benefit-card onboarding flow; completes mobile OTP, basic data, KYC steps	Row updated with final Name, mobile, status "Onboarded/Active"	Final status labels must align with SP Service
New employee invited with mobile + email	Employee ID, mobile, email	Invite created; SMS+email sent	Can click from either SMS or email, same flow	Same as above; both contact methods stored; Employer sees final email used	Confirm priority if employee changes email during onboarding

4.3 Employee – Existing Tide Member (KYC0 / Fully KYCed)

When the invited mobile/email already belongs to an existing Tide account, the behaviour should respect KYC state and ensure the **benefit-card entry point** is clear and separate from business onboarding.

A. Existing Member – KYC0 / RM (Minimal KYC)

- On clicking the invite link:
 - System detects an existing account tied to the invited mobile/email.
- Expected behaviour:
 - On app login (if not already logged in), the employee is taken to:
 - A **Benefit Card entry point** (e.g., banner/CTA) explicitly labeled “Join your employer’s benefit programme” or equivalent. (To be configured on flutter)
 - From this entry point, the employee can:
 - Accept their employer’s invitation.
 - Complete or upgrade KYC for the benefit product.
- Post-acceptance:
 - Benefit wallets/cards are created and tied to the employer’s programme, subject to KYC level rules (limits, restrictions).

B. Existing Member – Fully KYCed

- On clicking the invite link or subsequent logins:
 - System recognizes existing fully KYCed member.
- Expected behaviour:
 - Show a **dedicated invitation card/notification** on the Home tab (or equivalent):
 - Indicating the employer’s name and programme.
 - Allowing employee to accept or decline.
 - On acceptance:
 - All relevant benefit wallets (Meal, Fuel, Telecom, Rewards, etc.) linked to the employer are provisioned and visible.
- If the employee does not act immediately:
 - The invitation card/notification remains visible per product policy (reminder strategy to be as per the document [here](#)).

Existing Member Scenarios – Summary Table

Scenario	Input (Employer)	System Behaviour	Employee Experience	Employer View (Employee Mgmt)	Notes / Open Points
Existing Tide user with same mobile as invite (KYC0/RM)	mobile number , and other enrichment info (mobile number matches existing account), optional email	Recognize existing account; tie invite to that account; expose Benefit Card entry point after login	Sees CTA to “Join employer’s benefit programme”; completes any additional KYC required, then accepts invite	Sees employee row with final Name/mobile/email from existing account; status “Onboarded/Active” once accepted & KYC OK	
Existing Tide user with same email as invite but	email matches existing account; mobile in	Decide primary identifier; email match used to	Logs in via existing account; sees Benefit Card CTA	Employer sees final info from existing account; original file	Don't have mobile number update flow, use the mobile

different- mobile	file may- not match	identify- existing- account;- invite tied- to that- account;- mobile- behaviour;- existing- mobile- number	or Home- tab invite;- may need- to- confirm/u pdate- mobile	values- kept for- audit	number- present in- the- system-
Existing full KYC member	mobile match existing fully KYCed account	Recognize full KYC; show invite card on Home with employer details; easy accept	Accepts invitation, immediatel y sees created wallets (Meal/Fuel /etc.)	Status updated to “Onboarde d/Active”; shows final validated info; wallet details per separate configurati on PRD	

Note: What happens:

If an invited member signs up on the Tide app using a **different mobile number** than the one used in the original invitation, the referral code must be manually added via BOT. Once added, the employer will see the member's information in the Employee Management tab. The employer should then remove the outdated entry associated with the original (unused) invitation.

Example:

Step 1: Invitation Sent

- Employer invites John Doe using mobile number: **7700 900123**

Step 2: Member Signs Up with Different Number

- John Doe signs up on the Tide app using mobile number: **7700 900456** (different from the invite)

Step 3: Manual Intervention Required

- The referral code must be added manually via BOT for the number (**7700 900456**)
- Once added, John Doe's profile appears in the Employee Management tab

Step 4: Clean Up

- The employer should remove the outdated entry for the original invitation (**7700 900123**) to avoid confusion

5. Data & Identifier Requirements

Per Employee Invite Record

- **Employer-provided fields (required):**
 - Employee ID (primary corporate identifier, must be unique per employer).
 - Mobile number (primary contact; mandatory in India context).
- **Employer-provided fields (optional but recommended):**
 - Subsidiary.
 - Location.
 - Department / Cost Center (optional).

- Email address (optional; not mandatory).
- **System-generated fields:**
 - **Employee Invite Unique Identifier** (e.g., Employee Code) – mandatory, unique per invite record.
 - **Product Code** for benefit card proposition – mandatory; embedded in the invite link.
 - Employer/Corporate ID.
 - **Invite Link (Conceptual)**
- Employee Code (system-generated unique identifier).
- Product Code (to route to benefit-card-specific onboarding).
- Employer/Corporate ID and optional Programme ID.

6. Scenarios & Edge Cases

6.1 Main Scenario Matrix

Scenario	System Behaviour	Employee Experience	Employer View (Employee Mgmt)	Notes / To Discuss
New employee, mobile only	Invite via SMS; new account flow	Sms link → Benefit Card onboarding; sets up account and wallets	Sees final Name/mobile , status “Onboarded/ Active”	
New employee, mobile + email	Invite via SMS + email	Can join via either; single underlying invite record	Same as above; email from onboarding shown if captured	
Existing user, same mobile as invite (different email)	Link mapped to existing account via mobile; email differences ignored or reconciled	Logs in; sees Benefit Card CTA/invite card; accepts; may update email	Shows final info from existing account; not necessarily same as file	
Existing user, same email as invite (different mobile)	Link mapped via email; behaviour similar to above	Similar CTA/invite; may confirm/update mobile (Future Scope)	Shows final info; original mobile kept for audit	To be decided if mismatched mobile should trigger warning (Future scope)
Employee onboarded via bulk file	Same as above; only difference is entry method	Same as above	Same as above	Bulk vs single is operational, not

				functional difference
Invitation link expired				To be handled as per the document here
Employee invited by multiple employers (multi-employer)	Employee should not be linked with employer			

6.2 Edge Case Table

Edge Case	Condition	Expected Behaviour	Employer View	Employee View	Status / Notes
Duplicate Employee ID in bulk upload for same employer	Same Employee ID appears multiple times in file	Reject duplicates at validation; prompt employer to resolve before processing	Error report listing duplicate rows; upload not accepted for those entries	N/A	entire file fails or only affected rows
Same mobile used for multiple Employee IDs for same employer	Different Employee IDs share same mobile	Reject duplicates at validation; prompt employer to resolve before processing	Error report listing duplicate rows; upload not accepted for those entries	N/A	entire file fails or only affected rows
Employee is existing business customer/ admin	Invite mobile/email belongs to Business admin or owner account				Create account as Employee
Partial onboarding /	Employee starts benefit onboarding	Status remains "In progress"	Sees "In progress" for that employee;	On re-opening link within TTL,	State naming to be aligned with global

abandoned flow	g but doesn't finish KYC/flow	(or similar); invite link remains usable until TTL	can send reminders or re-invite post-TTL	resumes flow from last safe point	onboarding states
----------------	-------------------------------	--	--	-----------------------------------	-------------------

Implication on existing use case

The product code invitation should work for expense management as well.

7. Future Scope

The following items are **not in current scope** but are important for future phases and should be captured for roadmap and design alignment:

1. Skipping Non-Relevant Business Screens During Employee Onboarding

- For benefit-card-only onboarding, employees should **not** be asked for business-specific details, e.g.:
 - Business name.
 - Business category selection.
 - GST/registration details.
 - Any other fields that belong purely to Business current account onboarding flows.
- Future enhancement:
 - A dedicated **employee-only onboarding path** that:
 - Reuses core identity/KYC components.
 - Skips business fields completely.
 - Is clearly distinct at both product and compliance levels.

2. Employer-Initiated Updates to Employee Contact Details

- Future capability for corporates to:
 - Request updates to employee **mobile number** (e.g., number changed).
 - Request updates to employee **email address**.
- Expected future behaviour:
 - Employer triggers a “Contact Update Request”.

8. Product Code Present in India

Flow Type:

Flow type*

- PAYOUT_PARTNER
- REFERRAL_PARTNER
- PAYOUT_PARTNER

Target Product:

☐ UPI_QR

☐ INSTANT_CARD

☐ VKYC_PRIORITY

☐ UPI_QR_KYX_QUEUE

☐ VISA_CARD

☐ RUPAY_CARD

Select target product

9. Conflicts if member is added for both Benefit and Expense management Use Case in IN

ID	Scenario / Flow Description	Type of Funds Involved (EM vs BC vs Mixed)	Conflict / Complication	Impact (Employer / Employee / Platform / Compliance)	Severity (Low / Med / High)	Proposed Solution / Mitigation (Process-Level)	Assumptions / Open Questions
S-01	Benefit Card user onboarded to Expense Management: User already has BC funds (reimbursements from benefit claims) in general account. Employer now adds EM prepaid funds to the same general account.	Mixed (BC reimbursements + EM funds in general account)	General account contains both employee-owned funds (BC reimbursements) and employer-owned funds (EM allocations). No clear separation of ownership. When employer attempts pullback, they may inadvertently pull back employee-owned reimbursement funds.	Employer: May pull back funds they don't own, creating liability. Employee: Loss of personal funds. Platform: Reconciliation disputes, trust erosion. Compliance: Potential tax/regulatory breach if employee-owned benefit funds are treated as employer funds.	High	Sub-ledger segregation in general account: Maintain two logical sub-balances: (1) "EM Sub-Balance" (employer-owned, retractable), (2) "Personal/Reimbursement Sub-Balance" (employee-owned, non-retractable). Pullback operations can only act on EM Sub-Balance. Display both sub-balances separately in user and employer dashboards with clear labels	

						("Employer Funds" vs "Your Funds"). Enforce rule: EM pullback amount cannot exceed EM Sub-Balance at any time. Employee/LM should be given with two payment instrument for the required service to identify which account should be deducted.	
S-02	Expense Management user onboarded to Benefit Card: User already has EM funds in general account. Employer now enables BC; employee submits benefit claims (e.g., Meal) which are reimbursed to general account.	Mixed (EM funds + BC reimbursements in general account)	Same as S-01: General account now contains mixed funds. Employer may pull back EM funds and accidentally include BC reimbursements that were credited after EM allocation.	Employer: Risk of pulling back employee-owned funds. Employee: Loss of benefit reimbursements. Platform: Disputes and reconciliation overhead. Compliance: Tax implications if benefit reimbursements are clawed back.	High	Same sub-ledger segregation as S-01: All BC reimbursements credit to "Personal/Reimbursement Sub-Balance" only. All EM allocations credit to "EM Sub-Balance" only. Pullback rule: Employer can only pull back from EM Sub-Balance. Implement timestamp-based fund tracking to ensure FIFO/LIFO logic if needed for audit trails.	Assumption: Benefit claim reimbursements are always credited to general account (open-loop), not to closed-loop benefit wallets. Open Question: Should there be a cooling-off period after BC reimbursement before EM pullback is allowed, to avoid timing conflicts?
S-03	Employer pullback immediately after benefit	Mixed (EM funds + fresh BC reimbursements)	Timing conflict: BC reimbursement lands in	Employer: Pulls back funds they don't own.	High	Enforce sub-ledger segregation + real-time	Assumption: Platform can process fund tagging in

	claim reimbursement: Employee submits benefit claim (e.g., Fuel wallet claim). Claim is approved and reimbursed to general account. Shortly after, employer initiates EM fund pullback.	t in general account)	general account just before or during EM pullback. Without sub-ledger separation, employer may pull back the fresh reimbursement, which is employee-owned and non-retractable.	Employee: Immediate loss of approved benefit reimbursement. Platform: High dispute risk, operational friction. Compliance: Breach of benefit/tax rules (non-retractable funds clawed back).		fund tagging: Every credit to general account is tagged at source (EM allocation vs BC reimbursement t). Pullback logic checks EM Sub-Balance only. If EM Sub-Balance < pullback amount, transaction is blocked or partial pullback is executed up to available EM Sub-Balance. Notify employer of insufficient EM funds available for pullback.	real-time. Open Question: Should platform allow partial pullback (e.g., employer requests ₹10,000 but only ₹6,000 EM funds available), or should it be all-or-nothing?
S-04	Benefit claim reversal after funds mixed with EM: Employee's benefit claim (e.g., Meal) is approved and reimbursed to general account. Later, claim is found to be fraudulent/incorrect and must be reversed. Meanwhile, employee has also received EM funds in general	Mixed (EM funds + BC reimbursement, partially spent)	When reversing the BC reimbursement, platform must debit from Personal/Reimbursement Sub-Balance. However, if that sub-balance is insufficient (employee spent it), the reversal may fail or incorrectly debit from EM Sub-Balance, converting	Employer: EM funds may be used to cover employee's fraudulent claim reversal. Employee: May face negative balance or debt. Platform: Reconciliation complexity, potential write-offs. Compliance: Misattribution of fund ownership.	Medium	Implement sub-ledger-specific debit rules for reversals: Benefit claim reversals must debit from Personal/Reimbursement Sub-Balance only. If insufficient, create a negative balance in Personal/Reimbursement Sub-Balance (employee debt), but do NOT touch EM	Assumption: Platform can support negative sub-balances and freeze logic. Open Question: Who is liable for unrecoverable benefit claim reversals if employee exits before clearing debt? Should employer be notified and given option to recover via

	account and spent from mixed balance.		employer funds into employee liability.			Sub-Balance. Freeze employee's ability to spend from Personal/Reimbursement Sub-Balance until debt is cleared. Notify employee and employer of the reversal and debt. Employer cannot use EM pullback to clear employee's benefit claim debt.	payroll deduction?
S-05	Card transaction at benefit-eligible merchant with mixed funds: Employee swipes card at a Meal-eligible merchant (e.g., restaurant). User has: (1) Meal wallet (BC) with insufficient balance, (2) EM funds in general account, (3) Personal/Reimbursement funds in general account.	Mixed (BC Meal wallet + EM general + Personal general)	Benefit wallet rule: No partial debit; if Meal wallet insufficient, transaction declines. However, user has EM funds (employer-owned, for business expenses) and Personal funds (employee-owned). Should transaction fall back to general account? If yes, which sub-balance (EM or Personal)? EM funds are not for personal use; Personal funds may be intended for	Employer: EM funds may be used for personal/benefit expenses, violating policy. Employee: Confusion over which balance is debited; potential misuse of EM funds. Platform: Complex transaction routing logic. Compliance: Risk of tax misuse if EM funds used for benefit-eligible transactions.	High	Enforce strict benefit wallet-only rule for benefit-eligible merchants: If Meal wallet has insufficient balance, transaction is declined—no fallback to general account (EM or Personal). User must top up Meal wallet via benefit allocation or use a different payment method. Exception: Allow user to manually select "Pay from Personal Sub-Balance" at POS if platform	Assumption: Merchant category codes (MCCs) reliably identify benefit-eligible merchants. Open Question: What if a merchant is miscategorized (e.g., grocery store selling meals)? Should platform allow manual override or dispute process? Should there be a whitelist/blacklist of merchants for benefit wallets?

			non-meal purposes.			supports real-time payment source selection (future enhancement) . EM Sub-Balance is never used for benefit-eligible merchant transactions. Clearly communicate this rule to users via app notifications and onboarding.	
S-06	Card transaction at non-benefit merchant with mixed funds: Employee swipes card at a non-benefit-eligible merchant (e.g., office supplies, travel). User has EM funds and Personal/Reimbursement funds in general account.	Mixed (EM general + Personal general)	Transaction routing ambiguity: Should platform debit from EM Sub-Balance (employer-owned, for business expenses) or Personal Sub-Balance (employee-owned)? If EM is debited by default, employee's personal funds remain untouched but employer's funds are used. If Personal is debited, employee may not want to use their own money for business expenses.	Employer: EM funds may be used for non-business expenses if routing is incorrect. Employee: Personal funds may be used for business expenses, causing dissatisfaction . Platform: User complaints, refund requests. Compliance: Low risk, but policy adherence issues.	Medium	Implement default transaction routing hierarchy with user override: Default rule: For non-benefit merchants, debit from EM Sub-Balance first (if available), then Personal Sub-Balance. Rationale: EM funds are for business expenses; most non-benefit transactions are business-related. Allow user to set preference in app: "Always use Personal funds first" or "Always use EM funds	Assumption: Most non-benefit transactions are business-related. Open Question: Should platform require user to tag each transaction as "Business" or "Personal" at POS? This may hurt UX but improves accuracy. Should employer have visibility into which sub-balance was used for each transaction?

						first" for non-benefit transactions. Display available EM and Personal balances before transaction confirmation (if platform supports). Employer can set policy: "EM funds only for approved merchant categories" and block EM usage at certain MCCs.	
S-07	Employee exit/offboarding with mixed funds: Employee/free lancer is leaving the company. General account contains EM funds (employer-owned, must be pulled back) and Personal/Reimbursement funds (employee-owned, must remain with employee). Benefit wallets (Meal, Fuel, etc.) also have balances.	Mixed (EM general + Personal general + BC wallets)	Employer must pull back all EM funds but cannot touch Personal/Reimbursement funds or benefit wallet balances. Without sub-ledger separation, employer may pull back more than they own. Employee may also have pending benefit claims or transactions in-flight.	Employer: May not recover all EM funds if mixed with Personal funds. Employee: May lose Personal funds or benefit balances if pulled back incorrectly. Platform: High dispute risk, manual reconciliation required. Compliance: Regulatory breach if benefit funds are clawed back.	High	Mandatory pre-offboarding reconciliation process: (1) Freeze all new EM allocations and benefit claims 7 days before exit date. (2) Settle all pending transactions and claims. (3) Calculate final EM Sub-Balance and Personal Sub-Balance. (4) Employer pulls back only EM Sub-Balance; Personal Sub-Balance and all benefit wallet balances remain with employee. (5) Card is deactivated	Assumption: Platform can freeze specific fund types (EM) while keeping others active (BC). Open Question: What if employee has negative EM Sub-Balance (overspent EM funds)? Should employer recover via final payroll deduction? What if employee exits before benefit claim is approved—should claim be auto-rejected or processed and credited to employee's

						for EM use but remains active for Personal and BC use (if employee retains account post-exit). (6) Generate offboarding report showing final balances by sub-ledger for audit. Notify employee and employer of final balances and pullback amount 3 days before exit.	personal account?
S-08	Refund from benefit-eligible transaction: Employee made a Meal wallet transaction at a restaurant. Transaction is later refunded (e.g., order cancelled, chargeback). User also has EM and Personal funds in general account.	BC Meal wallet + Mixed general account	Refund routing ambiguity: Should refund go back to Meal wallet (original source) or to general account? If it goes to general account, should it credit EM Sub-Balance or Personal Sub-Balance? Incorrect routing may convert non-retractable benefit funds into retractable EM funds or vice versa.	Employer: If refund goes to EM Sub-Balance, employer gains funds they didn't originally own. Employee: If refund goes to EM Sub-Balance, employee loses their benefit refund. Platform: Reconciliation errors, fund misattribution. Compliance: Tax/benefit rule breach if benefit refunds are treated as EM funds.	Medium	Enforce refund-to-source rule: Refunds must always return to the original funding source. If transaction was debited from Meal wallet, refund credits Meal wallet. If debited from EM Sub-Balance, refund credits EM Sub-Balance. If debited from Personal Sub-Balance, refund credits Personal Sub-Balance. Platform must track original funding source for each transaction	Assumption: Platform can track original funding source at transaction level. Open Question: What if original wallet (e.g., Meal) is closed or user is offboarded? Should refund go to general account (Personal Sub-Balance) or be rejected? What if refund amount exceeds original transaction (e.g., merchant error)—where does excess go?

						(transaction-level metadata). If original source cannot be determined (legacy transactions), default refund to Personal Sub-Balance (employee-owned, safest assumption). Notify user of refund and destination balance.	
S-09	Refund from non-benefit transaction with mixed general account: Employee made a transaction at a non-benefit merchant (e.g., office supplies) using general account (mixed EM + Personal funds). Transaction is refunded.	Mixed (EM general + Personal general)	Refund routing ambiguity: Should refund credit EM Sub-Balance or Personal Sub-Balance? If platform debited EM first (per S-06 default rule), refund should go to EM. But if user manually selected Personal, refund should go to Personal. Without transaction-level tracking, refund may go to wrong sub-balance.	Employer: May not receive refund for EM-funded transaction. Employee: May not receive refund for Personal-funded transaction. Platform: Reconciliation disputes. Compliance: Low risk, but fund misattribution.	Low	Same refund-to-source rule as S-08: Track original funding source (EM Sub-Balance or Personal Sub-Balance) at transaction level. Refund credits the same sub-balance. If original source cannot be determined, apply default rule: Refund credits EM Sub-Balance if transaction was at business-related MCC; otherwise, credit Personal Sub-Balance. Provide user with transaction history showing funding	Assumption: Platform can track sub-balance usage at transaction level. Open Question: Should employer have visibility into refunds credited to EM Sub-Balance? Should platform auto-notify employer of EM refunds for audit purposes?

						source and refund destination for transparency.	
S-10	Employer attempts pullback exceeding available EM funds: Employer requests pullback of ₹50,000 EM funds. However, EM Sub-Balance is only ₹30,000 (employee spent ₹20,000 on business expenses). General account also has ₹40,000 in Personal Sub-Balance.	Mixed (EM general + Personal general)	Employer expects to pull back ₹50,000 but only ₹30,000 is available in EM Sub-Balance. Platform must decide: (1) Allow partial pullback (₹30,000 only), (2) Block pullback entirely, or (3) Allow pullback from Personal Sub-Balance (incorrect, as those are employee-owned funds).	Employer: Cannot recover full EM allocation; may perceive platform as unreliable. Employee: No direct impact if pullback is limited to EM Sub-Balance. Platform: Employer dissatisfaction , potential disputes. Compliance: Low risk if Personal funds are protected.	Medium	Allow partial pullback with clear notification: If EM Sub-Balance < requested pullback amount, platform executes partial pullback up to available EM Sub-Balance. Notify employer immediately: "Partial pullback completed: ₹30,000 of ₹50,000 requested. Remaining ₹20,000 unavailable (spent by employee on business expenses)." Provide employer with transaction history showing how EM funds were spent. Employer can choose to: (1) Accept partial pullback, (2) Recover shortfall via payroll deduction (outside platform), or (3) Wait for	Assumption: Employer accepts partial pullback as valid outcome. Open Question: Should platform allow employer to set "pullback reserve" (minimum EM balance that cannot be spent by employee) to ensure full pullback is always possible? Should employee be notified before employer pullback to avoid surprise balance changes?

						employee to top up EM Sub-Balance (if applicable). Platform never debits from Personal Sub-Balance for EM pullback.	
S-11	Benefit wallet top-up from general account (if allowed): Employee wants to top up Meal wallet from their general account (mixed EM + Personal funds).	Mixed (EM general + Personal general) → BC Meal wallet	If employee tops up Meal wallet from general account, which sub-balance should be debited—EM or Personal? EM funds are employer-owned and not meant for benefit wallets. Personal funds are employee-owned and can be used for benefit top-ups. Incorrect debit may allow employee to convert EM funds into non-retractable benefit funds.	Employer: EM funds may be converted into non-retractable benefit funds, preventing pullback. Employee: May inadvertently use EM funds for personal benefit top-ups. Platform: Fund misattribution, compliance risk. Compliance: High risk if EM funds are used for tax-saving benefit wallets.	High	Restrict benefit wallet top-ups to Personal Sub-Balance only: If employee initiates benefit wallet top-up from general account, platform debits from Personal Sub-Balance only. If Personal Sub-Balance is insufficient, top-up is declined. EM Sub-Balance can never be used to top up benefit wallets. Clearly communicate this rule in app: "Benefit wallet top-ups can only use Your Funds, not Employer Funds." Employer can separately allocate funds directly to benefit wallets (outside general account) if platform supports	Assumption: Platform supports employee-initiated benefit wallet top-ups from general account. Open Question: Should platform allow employer to directly allocate funds to employee's benefit wallets (e.g., Meal wallet) as part of compensation ? If yes, those funds should be tagged as non-retractable and separate from EM funds.

						employer-funded benefit allocations.	
S-12	Chargeback on benefit wallet transaction: Employee disputes a Meal wallet transaction (e.g., unauthorized charge, merchant fraud). Chargeback is initiated. Meanwhile, employee has EM and Personal funds in general account.	BC Meal wallet + Mixed general account	Chargeback process: (1) Provisional credit may be issued to employee during investigation. Where should provisional credit go—Meal wallet or general account? (2) If chargeback is won, refund should go to Meal wallet. (3) If chargeback is lost, provisional credit must be reversed. If provisional credit went to general account (mixed), reversal may incorrectly debit EM Sub-Balance.	Employer: EM funds may be used to cover lost chargeback reversal. Employee: May lose Personal funds if chargeback reversal debits wrong sub-balance. Platform: Complex chargeback reconciliation. Compliance: Medium risk if fund ownership is misattributed.	Medium	Chargeback provisional credit and reversal must follow source wallet: (1) Provisional credit during chargeback investigation goes to Meal wallet (original source). (2) If chargeback is won, credit remains in Meal wallet. (3) If chargeback is lost, debit from Meal wallet. (4) If Meal wallet has insufficient balance for reversal, create negative balance in Meal wallet (employee debt) and freeze Meal wallet until cleared. Do NOT debit from general account (EM or Personal Sub-Balance) for benefit wallet chargeback reversals. Notify employee of chargeback outcome and any debt.	Assumption: Platform can support negative balances and freezes at wallet level. Open Question: What if employee exits before clearing Meal wallet debt from lost chargeback? Should employer be notified? Should debt be written off or recovered via other means?

						Employee must top up Meal wallet from Personal Sub-Balance to clear debt.	
S-13	UX/Transparency: Balance display with mixed funds: User opens app to check balance. General account contains EM funds and Personal funds. User also has multiple benefit wallets (Meal, Fuel, Telecom, Rewards).	Mixed (EM general + Personal general + BC wallets)	User sees a single "General Account Balance" (e.g., ₹50,000) but doesn't know how much is employer-owned (EM) vs employee-owned (Personal). This creates confusion: "Can I spend all ₹50,000?" "Will employer pull back some of this?" Lack of transparency erodes trust and leads to support queries.	Employer: No direct impact, but may face employee questions about pullbacks. Employee: Confusion, anxiety about balance changes, potential overspending of EM funds. Platform: High support ticket volume, user dissatisfaction Compliance: Low risk, but poor UX.	Medium	Display sub-balances separately with clear labels: App home screen shows: (1) "Employer Funds (Business Expenses): ₹30,000" (EM Sub-Balance, retractable), (2) "Your Funds (Personal): ₹20,000" (Personal Sub-Balance, non-retractable), (3) Benefit wallets: Meal ₹5,000, Fuel ₹3,000, etc. Provide tooltip/info icon explaining: "Employer Funds can be pulled back by your employer at any time. Your Funds are yours to keep." Show transaction history with tags: "Paid from Employer Funds" or "Paid from Your Funds." Notify user 24 hours before	Assumption: Users prefer transparency over simplicity. Open Question: Should platform allow user to hide EM Sub-Balance if they find it confusing? Should employer have option to hide EM balance from employee view (e.g., for surprise bonus pullback)?

						employer pullback: "Your employer will pull back ₹10,000 from Employer Funds on [date]."	
S-14	Policy conflict: EM funds used at benefit-eligible merchant: Employee uses EM funds (employer-owned, for business expenses) at a Meal-eligible merchant (e.g., business lunch with client). Transaction is legitimate business expense but merchant is benefit-eligible.	EM general funds at BC-eligible merchant	Policy ambiguity: EM funds are for business expenses; Meal merchants are benefit-eligible. Is this transaction allowed? If yes, it may create tax/compliance issues (EM funds used at benefit merchant). If no, employee cannot use EM funds for legitimate business meals.	Employer: EM funds may be flagged for tax audit if used at benefit merchants. Employee: Legitimate business expense may be declined. Platform: Policy enforcement complexity. Compliance: High risk if tax authorities view EM-funded benefit merchant transactions as personal/benefit expenses.	High	Allow EM funds at benefit-eligible merchants but flag for employer review: Transaction is approved in real-time (to avoid declining legitimate business expenses). Transaction is auto-flagged in employer dashboard: "EM funds used at benefit-eligible merchant—review required." Employer can: (1) Approve (mark as business expense), (2) Reject (pull back funds and notify employee), or (3) Request receipt/justification from employee. Platform generates monthly report for employer:	Assumption: Employer is willing to review flagged transactions. Open Question: Should platform auto-decline EM funds at benefit merchants and require employee to use Personal funds or benefit wallets instead? This is safer for compliance but may hurt UX for legitimate business expenses. Should there be a whitelist of "business meal" merchants (e.g., airport lounges, hotels) where EM funds are always allowed?

						"EM funds used at benefit merchants" for tax/audit purposes. Employee is notified: "Your transaction at [merchant] used Employer Funds. Your employer may request a receipt."	
S-15	Regulatory audit: Mixed fund usage reporting: Tax authority or regulator audits the platform/employer. Requests report showing: (1) Benefit wallet usage (tax-exempt), (2) EM fund usage (business expenses), (3) Personal fund usage.	Mixed (EM general + Personal general + BC wallets)	Without clear sub-ledger separation and transaction-level tagging, platform cannot generate accurate report. Auditor may flag platform for non-compliance if benefit funds and EM funds are commingled. Employer may face penalties.	Employer: Regulatory penalties, tax liabilities. Employee: Potential tax implications if benefit usage is misreported. Platform: Regulatory action, loss of license. Compliance: High risk.	High	Implement transaction-level fund tagging and audit-ready reporting: Every transaction is tagged with: (1) Funding source (EM Sub-Balance, Personal Sub-Balance, or specific benefit wallet), (2) Merchant category (benefit-eligible or not), (3) Transaction type (spend, refund, chargeback, etc.). Platform maintains immutable audit log of all fund movements (allocations, pullbacks, top-ups, spends, refunds). Generate audit	Assumption: Platform has robust data infrastructure to support transaction-level tagging and audit logs. Open Question: Should platform proactively share audit reports with employer on monthly/quarterly basis, or only on-demand? Should employee have access to their own audit reports for tax filing purposes?

						reports on-demand: (1) "Benefit Wallet Usage Report" (all BC wallet transactions), (2) "EM Fund Usage Report" (all EM Sub-Balance transactions), (3) "Personal Fund Usage Report" (all Personal Sub-Balance transactions). Reports include transaction date, amount, merchant, MCC, and funding source. Provide reports to employer and regulator in standard format (CSV, PDF).
